REVIEW

- A computer memory is the space in a computer where data, information and programs are stored.
- The memory of computer is just like brain and note book.
- Random Access Memory (RAM) stores data temporarily.
- A secondary storage stores data permanently. Hard disk, optical disk and pen drive are secondary memories.
- A hard disk can store a huge amount of data permanently.
- An optical disk is a portable storage device that stores data permanently. It can store lesser amount of data than a hard disk. You need optical disk drive to read and write data on it.
- A pen drive is a small and portable permanent computer memory. You can easily read and write data on it.
